Weaving The Future

Envision A Better Connected World

SDN (Software-defined Networks)

Fundamentally, SDN is an IT transformation of data networking. Although similar concepts being proposed before, systematically applying SDN to data networking happens only recently. It brings a paradigm change of separating the control plane and data plane, logically centralized control, open and programmable data networking, etc.

Currently, almost all network vendors and IT power houses are working on SDN, and many industry alliances are formed to guide its development
SDN and NFV (Network Function Virtualization) have become a driving force in data networking

Huawei SDN/NFV with Industry

OPEN NETWORKING
FOUNDATION

- Main contributor in Carrier SDN, POF, and evolution to SDN
- Chair of Migration WG
- Vice Chair of Optical Transport WG

- Visible driver for Network Service Chain BoF and “Reliable Virtualized Network Function (VNF) Pool”
- Active contributor to IETF transition towards SDN

- Leads WP2/11 (SDN and resource control) in study period 2013-2016
- Appointed as WP chair and rapporteurs, editors, set up Sup-SDN, Q.CSO and Q.SBNG
- JCA-SDN

NFV ISG

World Class Standards

- Co-Chair of WG “Architecture of the Virtualization Infrastructure”
- Three editor positions in other WGs
- NFV overall Program Manager
- Most active contributor in the following areas:
E2E Architecture, Use Cases, Service Chaining

- SIMR WG 1 co-chair
- Several editorships in SIMR WG1, E2EA WG1, Marketing
- Initiated and leads Carrier SDN E2E solution (SD-313) and Flexible Service Chaining (SD-326)

- Joined as silver member

- Became as Gold member

WHAT IS CARRIER VALUE PROPOSITION IN NEW DIGITAL WORLD?!

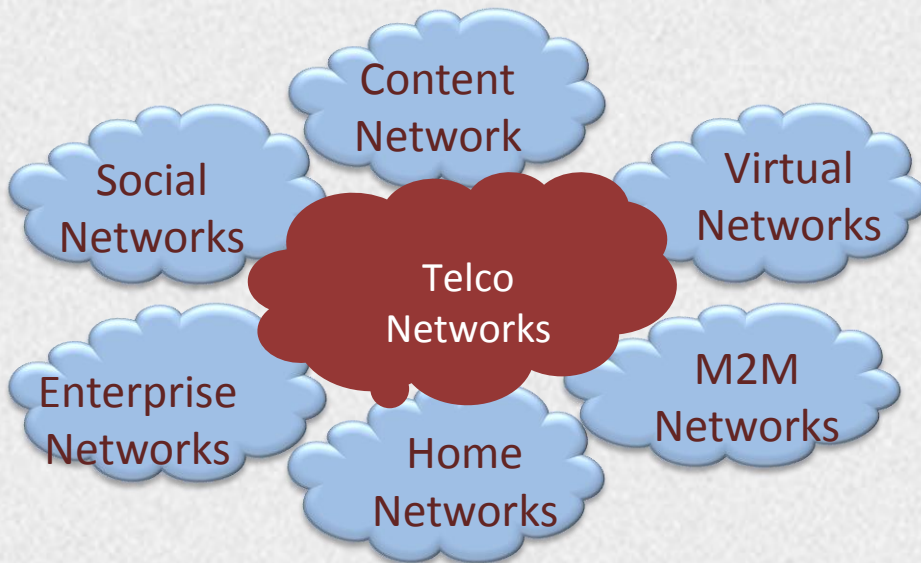

New Digital Economy:

Internet of Things

Enterprise Internet

Industrial Internet

WHAT IS CARRIER VALUE PROPOSITION IN NEW DIGITAL WORLD?!

Software Defined Networks Reshaping Modern Network Architectures

WHAT ARE FUNDAMENTALLY CHANGED IN TELCO BUSINESS

Traditional service model saturated & declining

Existing TCO structure may not be sustainable

Growing New Way
Saving New Way

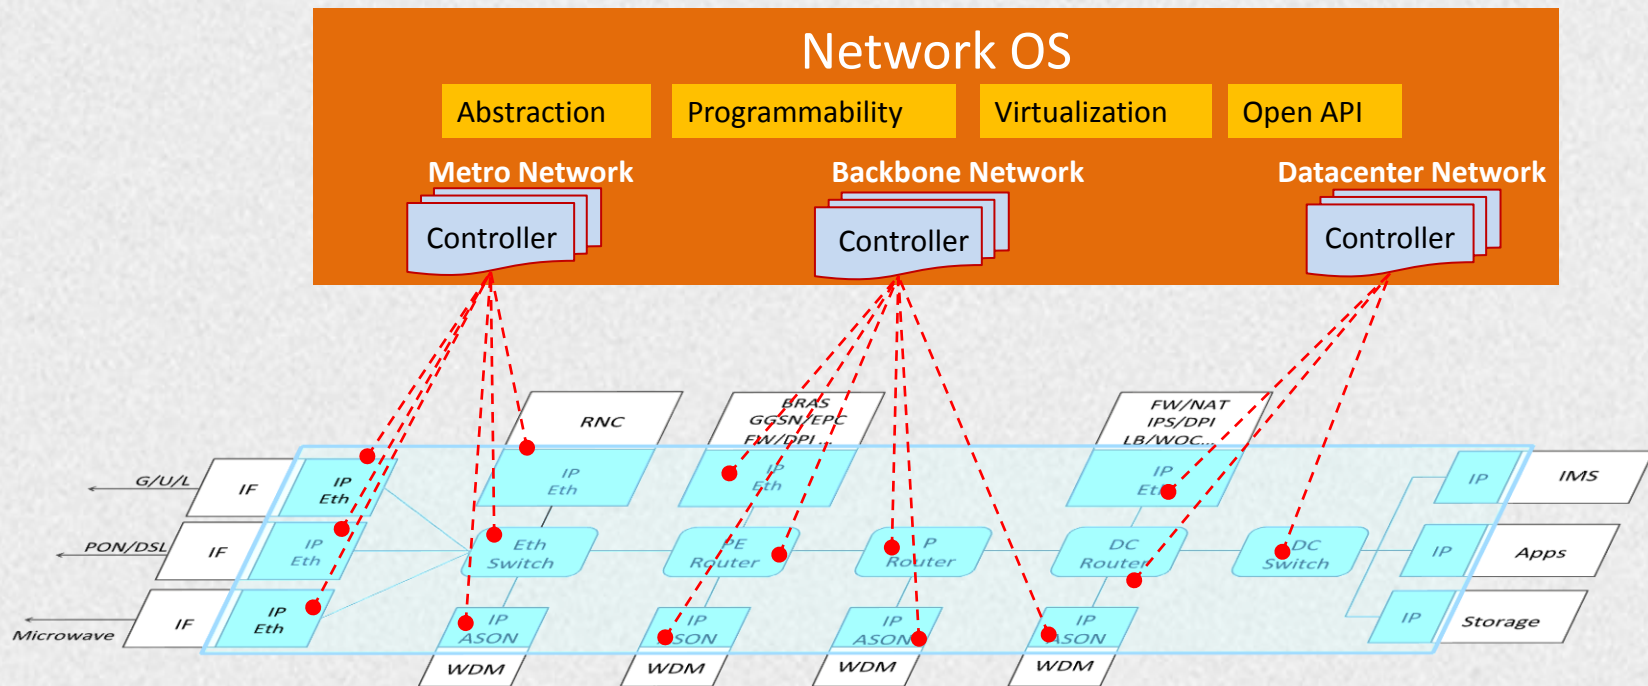

Potential opportunities huge in digital economy

Transform to new business operation models

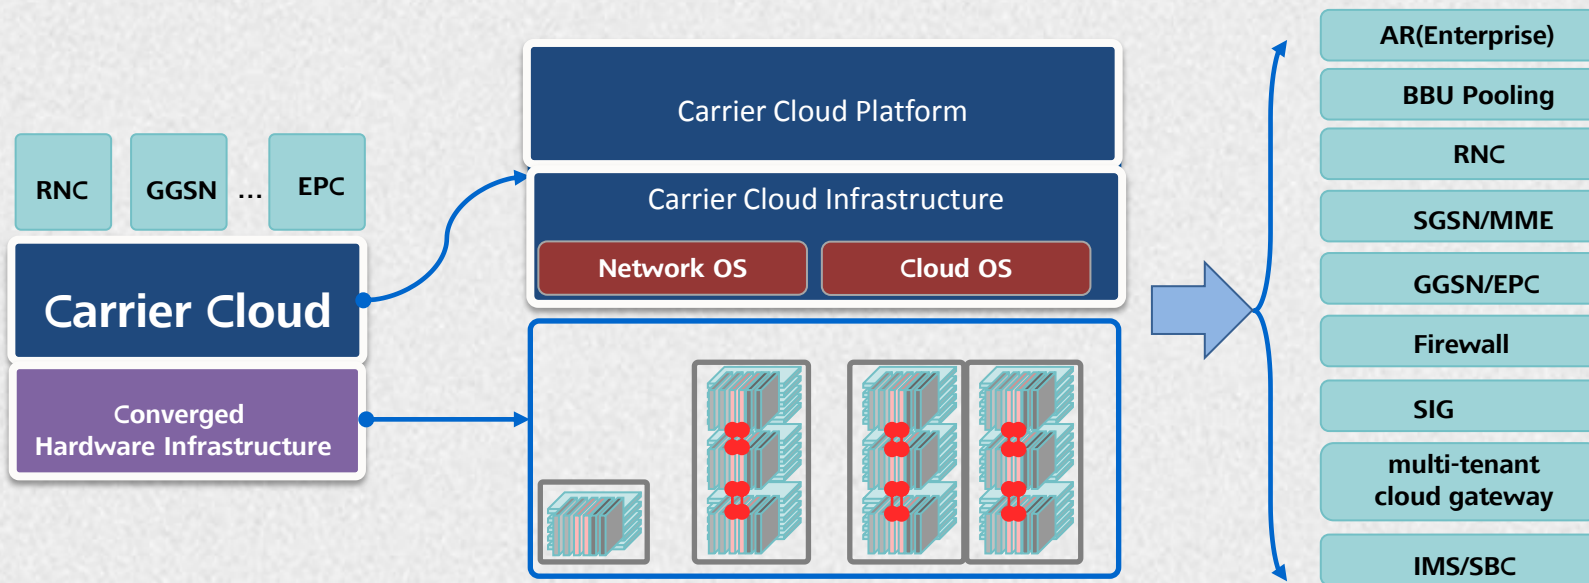

SDN IN NETWORK OS

- SDN Principle: Control Plane and Data Plane Separation
- To Structurally Optimize Networks and Simplify & Automate Control/Management

SDN+NFV FOR CLOUD EPC

- MIGRATE MOBILE NETWORK FUNCTIONS TO CLOUD-BASED SOFTWARE MODULES

- Such software Modules will be managed, integrated, tested & operated in Carrier Cloud
- Becoming highly scalable, distributed and elastic with much reduced TTM & Continue Integration with SDN+NFV

SDN Research at Shannon Lab

- **Non-compatible south-bound API** (Network fragmentation problem)
 - Industry first generalized SDN network controller (SOX) which can control and manage mixed SDN data networking with non-compatible south-bound APIs (e.g. OF1.0 and OF1.2 are not compatible),
 - Verified at Oct. 2012 ONF PlugFest and announced at the First World Congress on SDN, Oct. 2012, Germany and SDN interoperability evaluation at European Advanced Network Test Center (EANTC), Berlin, Germany, Feb. 2013
- **Multi-Controller** (Network congestion problem caused by single controller)
 - Shannon Lab SOX intelligent network controller - the first SDN controller to realize intelligent multi-controller function that passed the evaluation of ONF PlugFest, Oct. 2012
- **East-West Network Expansion** (whole network infrastructure of SDN)
 - SSDN (software-service-defined-network) : A software-service architecture for East-West network expansion of SDN (presented at First World Congress on SDN, Oct. 2012, Germany)

SDN Research at Shannon Lab

- **Software Engineering Architecture of SDN**
 - ❑ MDA (model-driven-architecture) and software engineering best practice for SDN
 - ❑ Successfully applied MDA and software engineering best practice framework to the design and implementation of the industry first generalized SDN controller
 - ❑ Published the first white paper on MDA based software engineering architecture for SDN and SDN controller at the First World Congress on SDN, Oct. 2012, Germany
- **SDN Controller and Data Plan**
 - ❑ The Huawei (SOX Controller/OF1.2 switch) - the only vendor that passed the advanced test cases based on new features of OF1.2 at European Advanced Network Test Center (EANTC) SDN interoperability test, Feb. 2013 (results announced at the SDN/MPLS World Congress at Paris, March, 2013)
 - ❑ SOX Controller for SDN with mixed OpenFlow (OF1.0 - OF1.3) switches
 - ❑ Data switching based on the latest OpenFlow 1.3 standards at ONF PlugFest 2013

SDN/OF Data Switch

Huawei S6710 Campus/To SDN Switch
(based on SN640 of Shannon Lab)

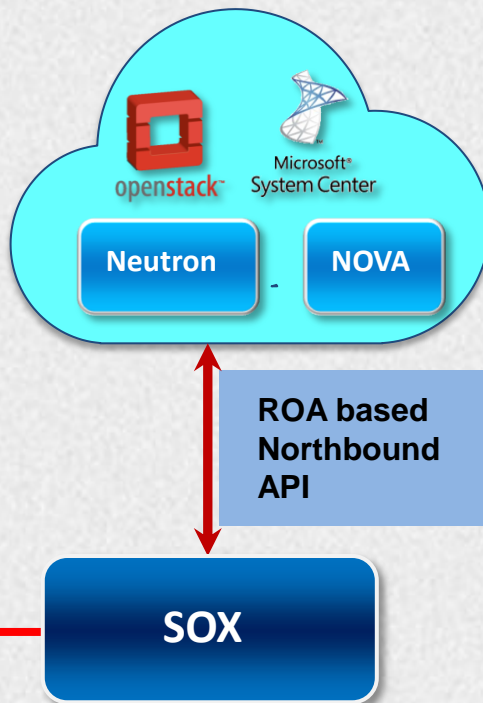

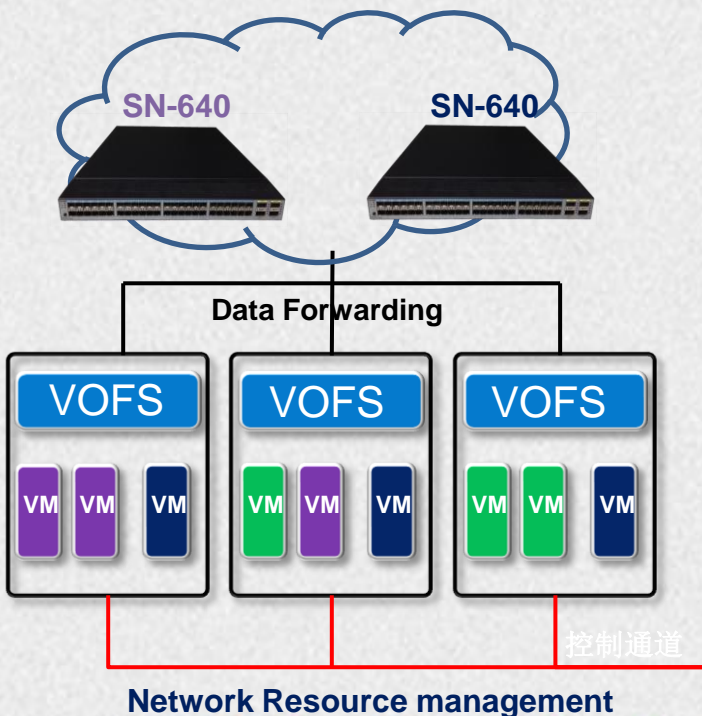

● System Configuration

- 48 × 10GE + 4 × 40GE (1U)
- 1.28Tbps non-blocking line speed
- Packet processing capability: 960Mpps
- Port to port latency: 300ns
- Industry first SDN/OpenFlow switch with hardware supporting of more than 3 flow tables (Pass ONF OF1.3 evaluation)

- SDN southbound API Protocol
 - OpenFlow 1.2/1.3
 - 9 stage pipeline with multiple flow table
 - Each stage with 70K flow entry
 - 36 matching filed (V2 support self-defined matching elements)
 - Support 10K group table, Bucket size 80K
 - Support OF1.3 features, e.g. Meter、Queue、Counter, etc.
- Network Service Capabilities
 - Unicast: MAC forwarding、IPv4/IPv6 forwarding
 - Multicast: Layer 2, Layer 3 IPv4/IPv6 multicast
 - VLAN: 4K per port
 - QoS
 - Per flow metering, with 24Kbps granularity
 - Each port with 12 queue , support queue based minimum bandwidth amd maximum bandwidth control
 - Support port based flow normalization
 - Reliability
 - Fast Failover group for link failiure
 - Alternative link to controller
 - Multi-controller
- New features in V2
 - Zero Touch Networking or Touch Free Networking
 - SDN OAM solution
 - Network virtualization solution (MPLS/VxLAN)

Shannon SDN and Cloud Solution

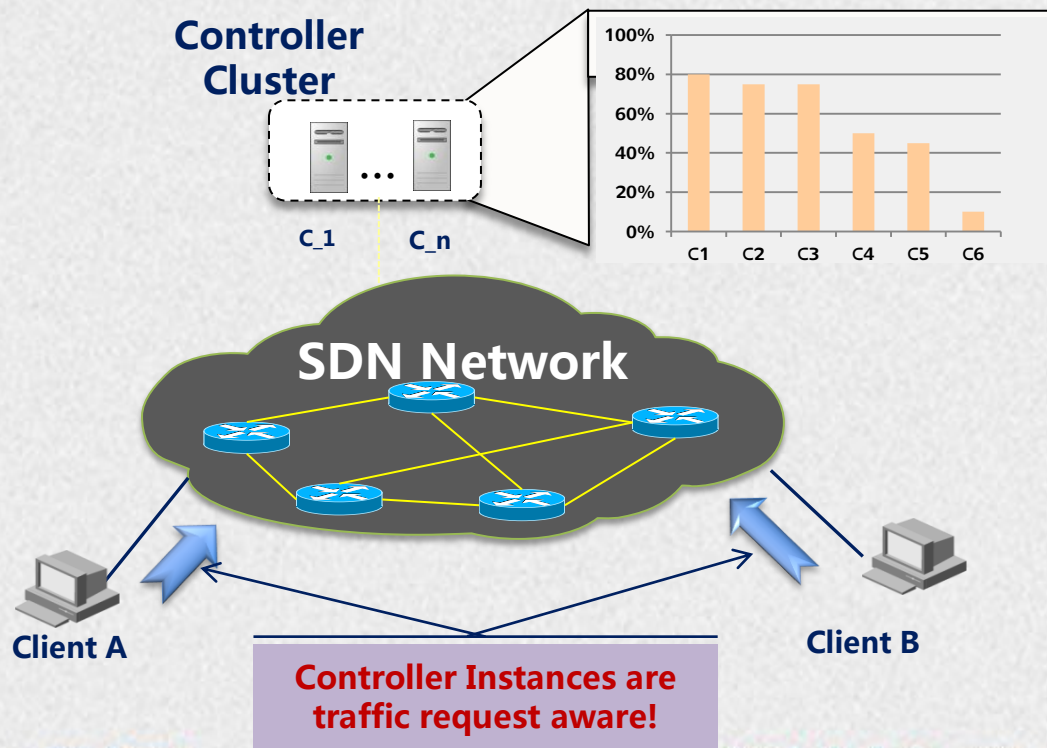

Unified control of network resources, programmable data processing platform

SDN Controller (SOX), hardware and software based SDN/OF switches

- ◆ Integrated with OpenStack and based on SOX to support OF1.0-OF1.3 based full network control
- ◆ OF1.2/1.3 based hardware SDN switch
- ◆ High efficiency SDN software switch VOFS
- ◆ ROA based northbound SDN API
- ◆ Maximize network resource utilization through dynamic multipath bandwidth control and load balancing
- ◆ Programmable and user defined routing policy and interface
- ◆ Hyper-link pipeline based service chaining

Multi-Controller —SDN based management engine

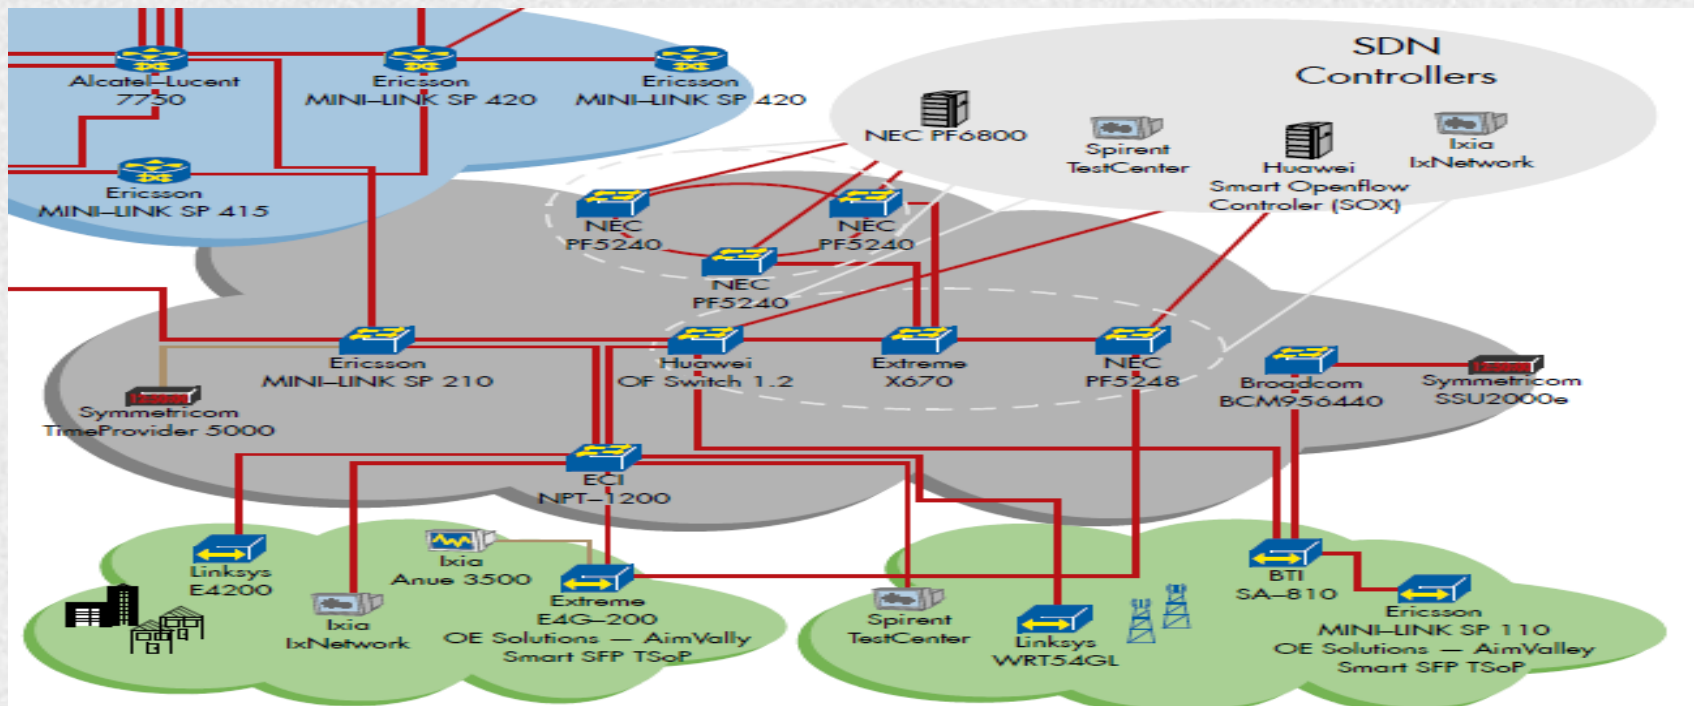

Traffic request aware controller instances

- ◆ Number of instances based on traffic load/new flow request
- ◆ More secure and reliable with multi-controller cluster

Controller load balancing

- ◆ Intelligent load balancing based on the load and traffic requests
- ◆ Scale out the capacity of the controller in a consistent way
- ◆ Integrated with ROA based northbound API

SOX: showcase in Paris, 2nd SDN Summit and 15th MPLS World Congress: Automatically transform untagged traffic with required tags (designed by EANTC)

SSDN (Software-Service-Defined Networks)

SSDN - SOA based approach to data networking

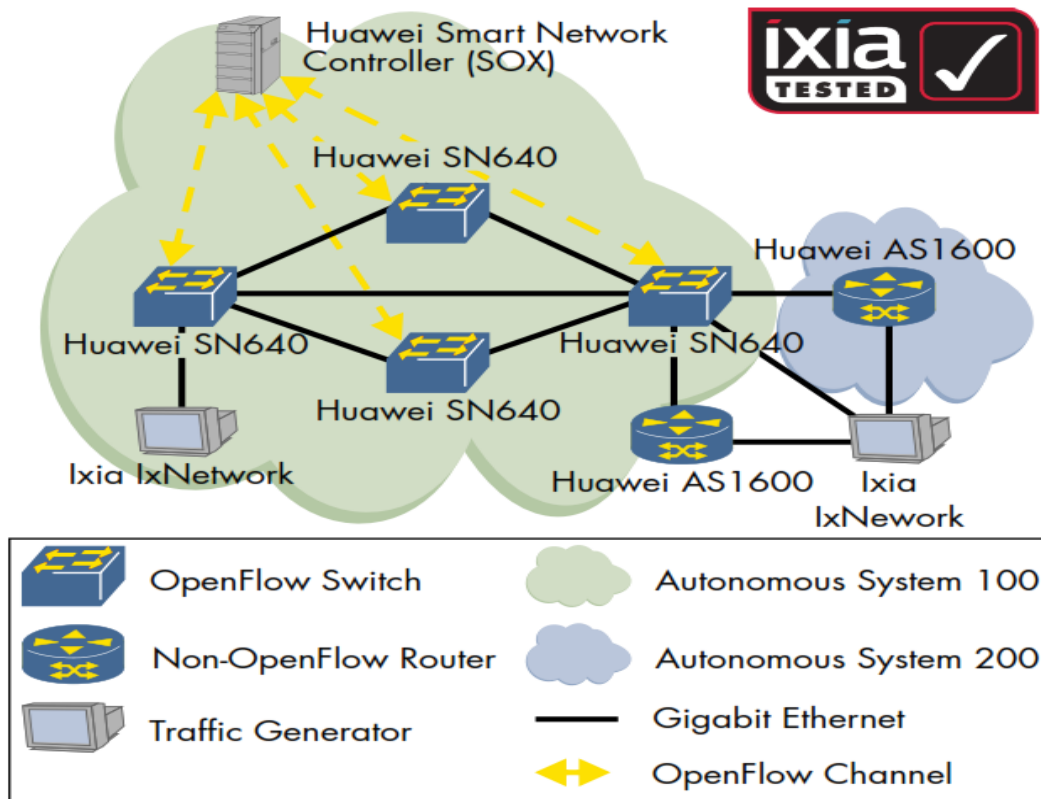

- ❑ Multiple network Services can be registered on SSDN platform. They can be managed and federated to provide the mapping for crossing controller services
- ❑ Service Orchestration: including chaining and pipeline
- ❑ Develop and improve ROA based network API (NAPI)

SDN/OpenFlow with Traditional Network

Seamlessly inter-networking with traditional networks

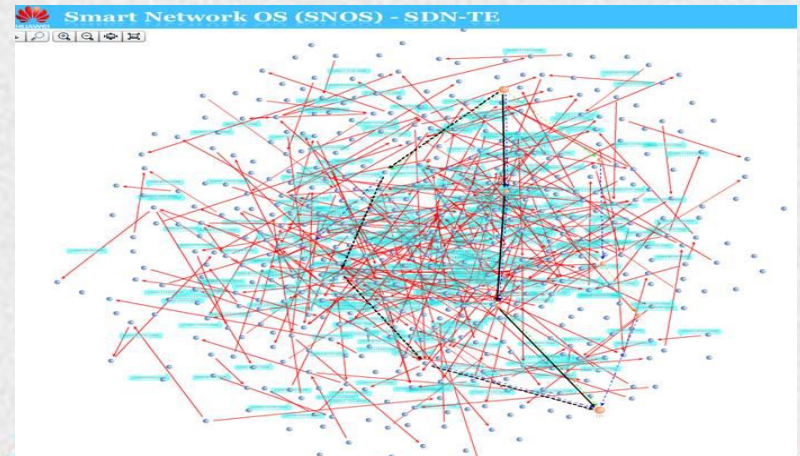

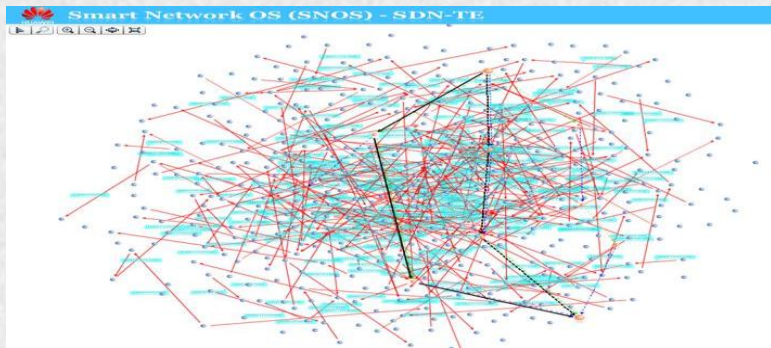

- ◆ SOX makes SDN as AS and interworking with non-SDN based existing networks
- ◆ Support E2E MPLS/TE crossing SDN/OF domain
- ◆ Support multipath data forwarding with legacy devices
- ◆ Intelligent and fast failure recovery (<50ms) required for carrier network services
- ◆ Support carrier grade differentiated QoS for different applications

Intelligent Multipath, Global Network Topology and State Aware Management Algorithms

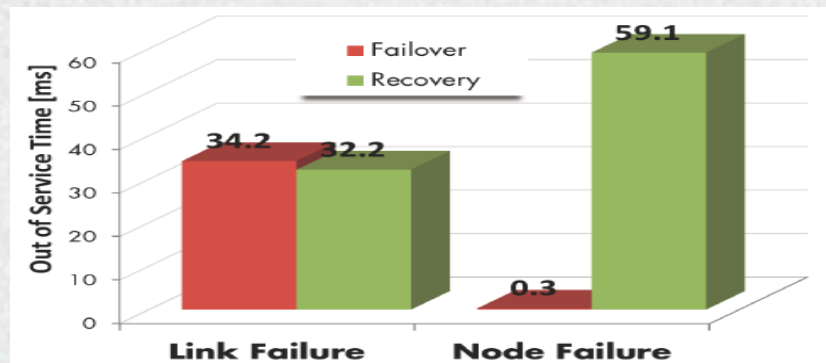

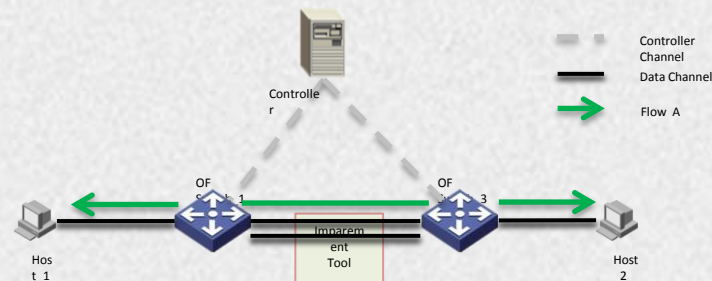

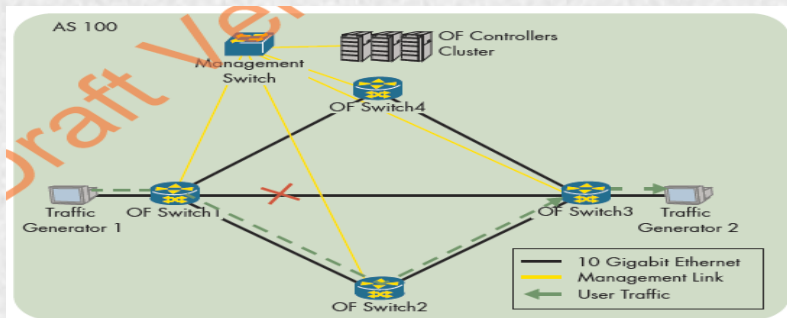

Intelligent, self-adjustable, dynamic multipath framework (ADMCF) to address the needs in large centralized network control and resource optimization problems

Fast Failover in SDN (EANTC-Huawei Showcase 1.3 & 1.4)

- SDN/OF with carrier-grade resiliency (<50ms)

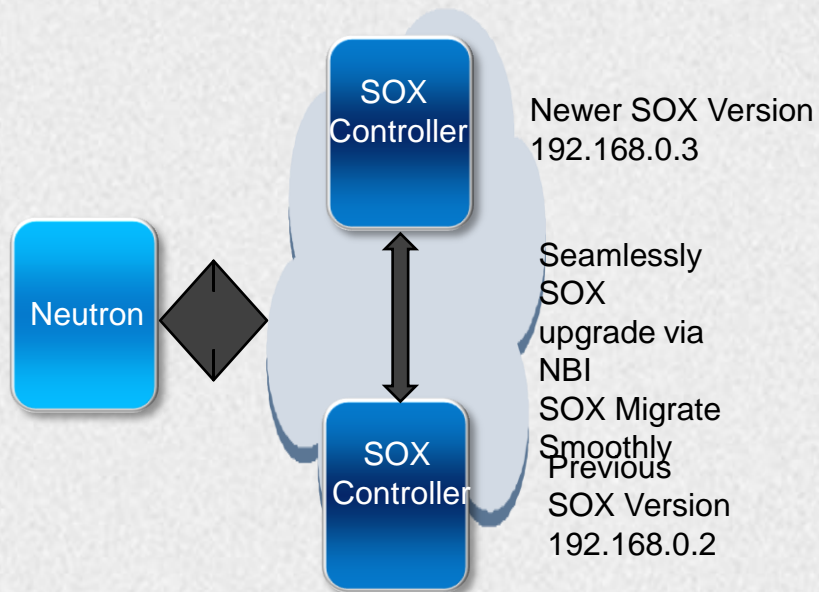

ROA (resource-oriented) based Northbound API HUAWEI

Current SDN Northbound API

- Fixed resource URI
- Not loosely coupled, do not support late binding, resource migration, discovery, etc.
- Resource identity and media type are tightly coupled, requiring dedicated API for each media type
- Do not support media type negotiation and discovery

ROA based SDN northbound API

- Support resource migration without impact application
- Loosely coupled and support late resource binding, resource updates, and resource discovery
- Decouple the resource identity and media type
- Support media type negotiation and discovery to maximize the resource utilization

Summary

- **SDN – IT transformation of data networking**
 - SDN - a growing area in data networking industry
 - SDN technology - fast advancing, being applied to data center, carrier, enterprise, family, wired line, wireless, optical network, terminal, etc.
 - SDN+NFV – changing the landscape of network hardware, software, and the architecture of next generation data networks
 - SDN+NFV – new networking and service opportunities
 - SDN+NFV – leading to a new industry ecosystem, a challenge to existing infrastructures as well as a huge opportunity for the industry

Thank you!
